About this class

This course is designed to start you on a new career path towards becoming an Energy Futurist or just out of interest. **Energy Futurists** earn huge amounts of money as advisors to government, businesses and in-house, using their skills to wisely invest in the future. You don't need to do the course on financials or on Micro-renewable energy but they will help you a little.

Python is a very simple language, and has a very straightforward syntax. It encourages programmers to program without boilerplate (prepared) code. The simplest directive in Python is the "print" directive - it simply prints out a line (and also includes a newline, unlike in C).

There are two major Python versions, Python 2 and Python 3. Python 2 and 3 are quite different. This tutorial uses Python 3, because it more semantically correct and supports newer features.

For example, one difference between Python 2 and 3 is the print statement. In Python 2, the "print" statement is not a function, and therefore it is invoked without parentheses. However, in Python 3, it is a function, and must be invoked with parentheses.
